

EX # 2.6

Q.No.1

use synthetic division to find the Quotient and the remainder, when

i $(x^2 + 7x - 1) \div (x + 1)$

$$(x^2 + 7x - 1) \div (x + 1)$$

As $x + 1 = x - (-1)$, so $a = -1$

Now, write the co-efficient of x from dividend in a row and $a = -1$ on the left side.

$$\begin{array}{r|rrr} & 1 & 7 & -1 \\ -1 & \downarrow & -1 & -6 \\ \hline & 1 & 6 & -7 \end{array}$$

Quotient = $Qx = x + 6$ and remainder = -7

ii

$$(4x^2 - 5x + 15) \div (x + 3)$$

$$(4x^2 - 5x + 15) \div (x + 3)$$

As $x + 3 = x - (-3)$ so, $a = -3$

Now, write the co-efficient of x from dividend in a row and $a = -3$ on the left side.

$$\begin{array}{r|rrr} & 4 & -5 & 15 \\ -3 & \downarrow & 12 & -36 \\ \hline & 4 & -12 & 31 \\ & & & -78 \end{array}$$

Quotient = $Qx = 4x^2 - 12x + 31$

Remainder = -78

iii

$$(x^3 + x^2 - 3x + 2) \div (x - 2)$$

$$(x^3 + x^2 - 3x + 2) \div (x - 2)$$

As $x - 2 = x - (2)$ so $a = 2$

Now, write the co-efficients of x from dividend in a row and $a = 2$ on the left side

$$\begin{array}{r|rrrr} & 1 & 1 & -3 & 2 \\ 2 & \downarrow & 2 & 6 & 6 \\ \hline & 1 & 3 & 3 & 8 \end{array}$$

$$\text{Quotient} = Q(x) = x^2 + 3x + 3$$

$$\text{Remainder} = 8$$

Q.No. 2

Find the value of h using synthetic division, if

3 is the zero of polynomial $2x^3 - 3hx^2 + 9$

$P(x) = 2x^3 - 3hx^2 + 9$ and 3 is its root.

$$\begin{array}{r|rrrr} & 2 & -3h & 0 & 9 \\ 3 & \downarrow & 6 & 3(6-3h) & 9(6-3h) \\ \hline & 2 & (6-3h) & 3(6-3h) & 9+9(6-3h) \end{array}$$

$$\text{Quotient} = Q(x) = 2x^2 + (6-3h)x + 3(6-3h)$$

$$\text{Remainder} = 9 + 9(6-3h)$$

If 3 is zero of given polynomial.

$$\text{So, } 9 + 9(6-3h) = 0$$

$$9 + 54 - 27h = 0$$

$$63 - 27h = 0$$

$$h = \frac{63}{27}$$

$$h = 7/3$$

Sardar Abdul Qadeer Malik

PhD(Mathematics Scholar)

HOD Math Department

ii. 1 is the zero of polynomial

$$P(x) = x^3 - 2hx^2 + 11$$

1	↓	1	-2h	0	11
1	↓	1	(1-2h)	(1-2h)	11+(1-2h)

Quotient = $Q(x) = x^2 + (1-2h)x + (1-2h)$

Remainder = $11 + (1-2h)$

As 1 is the zero of given polynomial

So $R = 11 + (1-2h) = 0$

$$11 + 1 - 2h = 0$$

$$12 - 2h = 0$$

$$-2h = -12$$

$$h = 6$$

iii. -1 is the zero of polynomial $2x^3 + 5hx - 23$

$$P(x) = 2x^3 + 5hx - 23$$

-1	↓	2	0	5h	-23
-1	↓	-2	-2	-(5h+2)	-23-(5h+2)

Quotient = $Q(x) = 2x^2 - 2x + (5h+2)$

Remainder = $-23 - (5h+2)$

As -1 is the zero of polynomial.

So,

$$R = -23 - (5h+2) = 0$$

$$-23 - 5h - 2 = 0$$

$$-25 - 5h = 0$$

$$-5h = 25$$

$$h = -5$$

Q.No.3

Use synthetic division to find the values of l and m . if

i $(x+3)$ and $(x-2)$ are the factors of polynomial $x^3 + 4x^2 + 2lx + m$

$$P(x) = x^3 + 4x^2 + 2lx + m$$

and -3 and 2 are the roots.

For $x = -3$

$$\begin{array}{r|rrrr} & 1 & 4 & 2l & m \\ -3 & \downarrow & -3 & -3 & -3(2l-3) \\ \hline & 1 & 1 & (2l-3) & m-3(2l-3) \end{array}$$

$$\text{Quotient} = Q(x) = x^2 + x + (2l-3)$$

$$\text{Remainder} = m - 3(2l-3)$$

As $(x+3)$ is the factor of given polynomial

So, $m - 3(2l-3) = 0$

$$m - 6l + 9 = 0 \quad \text{--- (i)}$$

For $x = 2$

$$\begin{array}{r|rrrr} & 1 & 4 & 2l & m \\ 2 & \downarrow & 2 & 12 & 2(2l+2) \\ \hline & 1 & 6 & (2l+12) & m+2(2l+12) \end{array}$$

$$\text{Quotient} = Q(x) = x^2 + 6x + 2l + 12$$

$$\text{Remainder} = m + 2(2l+12)$$

As $(x-2)$ is the factor. so,

$$m + 2(2l+12) = 0$$

$$m + 4l + 24 = 0 \rightarrow \text{ii)}$$

Subtract (i) and (ii)

$$\begin{array}{r} m - 6l + 9 = 0 \\ -m + 4l + 24 = 0 \\ \hline -10l - 15 = 0 \end{array}$$

Sardar Abdul Qadeer Malik

PhD(Mathematics Scholar)

HOD Math Department

0341-5838491

$$-10l = 15$$

$$l = \frac{15}{-10}$$

$$l = -\frac{3}{2} \text{ put in (i)}$$

$$m - 6\left(\frac{-3}{2}\right) + 9 = 0$$

$$m + 9 + 9 = 0$$

$$m = -18$$

$$\text{So, } l = -\frac{3}{2}, m = -18$$

ii $(x-1)$ and $(x+1)$ are the factors of polynomial

$$x^3 - 3lx^2 + 2mx + 6$$

$$p(x) = x^3 - 3lx^2 + 2mx + 6$$

$\therefore 1$ and -1 are the roots

$$\text{For } a = 1$$

1	1	-3l	2m	6
1	↓	1	(1-3l)	2m+(1-3l)
1		(1-3l)	2m(1-3l)	6+2m+(1-3l)

$$\text{Quotient} = Q(x) = x^2 + (1-3l)x + 2m + (1-3l)$$

$$\text{Remainder} = 6 + 2m + (1-3l)$$

As $(x-1)$ is the factor of polynomial.

$$6 + 2m + (1-3l) = 0$$

$$6 + 2m + 1 - 3l = 0$$

$$7 + 2m - 3l = 0 \text{ --- (i)}$$

$$\text{For } a = -1$$

-1	1	-3l	2m	6
-1	↓	-1	-(-3l-1)	-(2m-(-3l-1))
1		(-3l-1)	2m-(-3l-1)	6-(2m-(-3l-1))

$$\text{Quotient} = Q(x) = x^2 - (3l+1)x + 2m + (3l+1)$$

$$\text{Remainder} = 6 - (2m - (-3l-1))$$

Sardar Abdul Qadeer Malik

PhD(Mathematics Scholar)

HOD Math Department

0341-5838491

As $(x+1)$ is the factor:-

$$6 - (2m - (-3l + 1)) = 0$$

$$6 - [2m + 3l + 1] = 0$$

$$6 - 2m - 3l - 1 = 0$$

$$5 - 2m - 3l = 0 \quad \text{--- (i)}$$

Add (i) and (ii)

$$7 + 2m - 3l = 0$$

$$5 - 2m - 3l = 0$$

$$12 - 6l = 0$$

$$-6l = -12$$

$$l = 2 \quad \text{put in (i)}$$

$$7 + 2m - 3(2) = 0$$

$$7 + 2m - 6 = 0$$

$$1 + 2m = 0$$

$$2m = -1$$

$$m = -1/2$$

So, $l = 2$, $m = -1/2$

Q.No.4

(i) Solve by using synthetic division, if 2 is the root of the equation $x^3 - 28x + 48 = 0$

$P(x) = x^3 - 28x + 48$ and 2 is root.

So,

$$\begin{array}{r|rrrr} & 1 & 0 & -28 & 48 \\ 2 & \downarrow & & & \\ \hline & 1 & 2 & -24 & 0 \end{array}$$

$$\text{Quotient} = Q(x) = x^2 + 2x - 24$$

$$\text{Remainder} = 0$$

Sardar Abdul Qadeer Malik

PhD(Mathematics Scholar)

HOD Math Department

0341-5838491

The depressed equation is

$$x^2 + 2x - 24 = 0$$

$$x^2 + 6x - 4x - 24 = 0$$

$$x(x+6) - 4(x+6) = 0$$

$$(x-4)(x+6) = 0$$

$$x-4=0$$

$$x=4$$

$$x+6=0$$

$$x=-6$$

So, the roots are 2, 4 & -6

(iii)

3 is the root of the equation

$$2x^3 - 3x^2 - 11x + 6 = 0$$

$P(x) = 2x^3 - 3x^2 - 11x + 6$ and 3 is the root.

	2	-3	-11	6
3	↓	6	9	-6
	2	3	-2	0

$$\text{Quotient} = Q(x) = 2x^2 + 3x - 2$$

$$\text{Remainder} = 0$$

The depressed Equation is

$$2x^2 + 2x - 2 = 0$$

$$2x^2 + 4x - x - 2 = 0$$

$$2x(x+2) - 1(x+2) = 0$$

$$(2x-1)(x+2) = 0$$

$$2x-1=0$$

$$x+2=0$$

$$2x=1$$

$$x=-2$$

$$x=1/2$$

So roots are, $3, 1/2$ and -2 .

III -1 is the roots of the equation

$$4x^3 - x^2 - 11x - 6 = 0$$

$P(x) = 4x^3 - x^2 - 11x - 6$ and -1 is root.

4	-1	-11	-6	
-1	↓	-4	5	6
4	-5	-6	0	

Quotient = $Q(x) = 4x^2 - 5x - 6$

Remainder = 0

The depressed Equation:-

$$4x^2 - 5x - 6 = 0$$

$$4x^2 - 8x + 3x - 6 = 0$$

$$4x(x-2) + 3(x-2) = 0$$

$$(4x+3)(x-2) = 0$$

$$4x+3 = 0$$

$$x-2 = 0$$

$$4x = -3$$

$$x = 2$$

$$x = \frac{-3}{4}$$

So, the roots are $-1, \frac{-3}{4}, 2$

Q.No.5

Solve by using synthetic division, if

(i) 1 and 3 are roots of equation $x^4 - 10x^2 + 9 = 0$

$P(x) = x^4 - 10x^2 + 9$ and 1 & 3 are roots

1	1	0	-10	0	9	
1	↓	1	1	-9	-9	
1	1	-9	-9	0		
3	↓	3	12	9		
1	4	3	0			

Quotient = $Q(x) = x^2 + 4x + 3$

Remainder = 0

The depressed equation is

$$x^2 + 4x + 3 = 0$$

$$x^2 + 3x + x + 3 = 0$$

$$x(x+3) + 1(x+3) = 0$$

$$(x+1)(x+3) = 0$$

$$x+1 = 0$$

$$x = -1$$

$$x+3 = 0$$

$$x = -3$$

So the roots are 1, 3, -1, -3.

ii) 3 and -4 are the roots of the equation.

$$x^4 + 2x^3 - 13x^2 - 14x + 24 = 0$$

$P(x) = x^4 + 2x^3 - 13x^2 - 14x + 24$ and 3, -4 are roots.

	1	2	-13	-14	24
3	↓	3	15	6	-24
	1	5	2	-8	0
-4	↓	-4	-4	8	
	1	1	-2	0	

Quotient = $Q(x) = x^2 + x - 2$ and Remainder = 0

The depressed equation is,

$$x^2 + x - 2 = 0$$

$$x^2 + 2x - x - 2 = 0$$

$$x(x+2) - 1(x+2) = 0$$

$$(x-1)(x+2) = 0$$

$$x-1 = 0$$

$$x = 1$$

$$x+2 = 0$$

$$x = -2$$

So, the roots are 3, -4, 1, -2
